

TEST SUMMARY REPORT

Automation Test Store — Web Store

Version 1.0 April 2026

1. Executive Summary

Manual test execution for the Automation Test Store demo web application is complete. A total of 120 test cases were executed across six modules: Registration, Authentication, Search, Cart, Checkout, and User Interface. Of these, 106 passed, 13 failed, and 1 was blocked, giving an overall pass rate of 88.3%.

Fourteen defects were logged (see the accompanying Bug Report). One issue — oversell at Checkout — is rated Critical, three are rated High severity, four Medium, and six Low. No defects blocked overall test execution; the single Blocked test case (UI_16) reflects an unimplemented feature rather than an execution failure.

2. Overall Test Execution Metrics

Metric	Count
Total Test Cases Planned / Executed	120
Passed	106
Failed	13
Blocked	1
Overall Pass Rate	88.3%

3. Module-wise Execution Breakdown

Module	Total	Passed	Failed	Blocked	Pass Rate
Registration	20	18	2	0	90.0%
Authentication	20	17	3	0	85.0%
Search	20	18	2	0	90.0%
Cart	20	18	2	0	90.0%
Checkout	20	18	2	0	90.0%
User Interface	20	17	2	1	85.0%

4. Defect Summary

Severity	Count	Example
Critical	1	Checkout_12 — order confirmed despite item going out of stock
High	3	Login_06 — no account lockout after repeated failed logins
Medium	4	Checkout_18 — invalid postal code format accepted
Low	6	Search_09 — auto-complete suggestions not implemented

Full defect details, reproduction steps, and severity/priority ratings are recorded in the Bug Report (Bug_Report.xlsx).

5. Key Findings

5.1 Strengths

- Core happy-path flows — registration, login, search, cart, and checkout — function correctly and consistently.
- Input sanitization against SQL injection and XSS payloads passed on all tested fields.
- UI responsiveness across mobile, tablet, and desktop viewports performed well, with consistent rendering across Chrome, Firefox, Safari, and Edge.

5.2 Areas of Concern

- Checkout_12 (Critical): the application can confirm an order for an item that goes out of stock during checkout, risking overselling.
- Login_06 and Login_11 (High): account lockout is not enforced after repeated failed logins, and a cached account page briefly renders after logout — both are security-relevant gaps.
- Cart_05 (High): out-of-stock products can still be added to the cart without warning.
- Several minor UI/usability gaps were noted (missing password toggle, clear-search button, clear-cart button, auto-complete, newsletter popup, and a non-functional language switcher).

6. Recommendations

- Prioritize a fix for Checkout_12 before release — this directly affects order integrity and revenue.
- Address the two High-severity Authentication findings (Login_06, Login_11) given their security implications.
- Re-test all 14 logged defects once fixes are delivered, and re-run the affected module's full test suite as regression.
- Treat Low-severity UI/usability items as backlog items for a future release rather than release blockers.

7. Conclusion

Testing is complete and the application is largely stable, with an 88.3% pass rate across 120 test cases. One Critical and three High-severity defects should be reviewed by the Project Manager and Product Owner before a release decision is made.
